

# Introducing the Zmodo Greet

## How to use the main features

### Answering Calls

When somebody presses your doorbell, a push notification will be sent to your smartphone (Note: please make sure that you are logged into MeShare on your device). Press the notification, and a call screen will appear. From there, you can answer the call.

### Home Screen

When you first open your MeShare app, you'll be led to your device list. If you have multiple devices, you can scroll until you find the Doorbell. From here, you can view your alerts (the Doorbell automatically saves a 30 second clip when motion is detected), you can quickly share your device, and you can view your device's live view by pressing on the thumbnail image.

### Live View

There are two main functions on the live view screen:

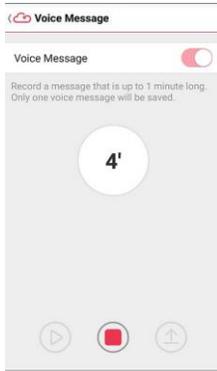

1) *Manually toggle the infrared night vision.* The camera will automatically adjust when it is dark outside, however you have to option of choosing to disable or enable the night-vision for a clearer image.

2) *Take a snapshot.* You can take a snapshot at anytime. This image will save to your cloud storage, and can be found in Events -> Gallery in your app.

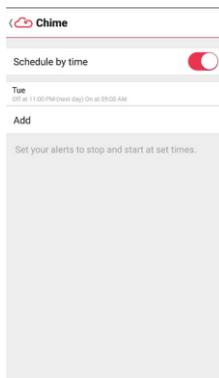

### Push-to-talk

You can see, hear and speak to your visitors through your phone by holding down the push-to-talk button on your live screen.

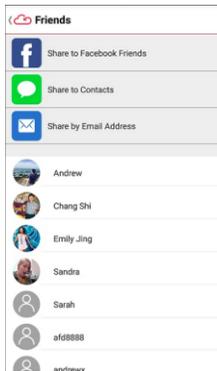

### Voice Message

You can enable and record a voice message that will play automatically if the doorbell isn't answered within 30 seconds of ringing. Call this your personalized "away" message, for when you can't answer the door, or just don't want to. This can be found under the settings menu.

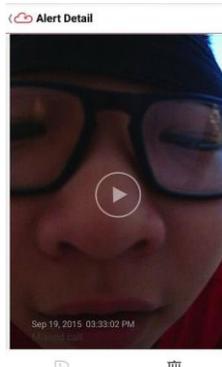

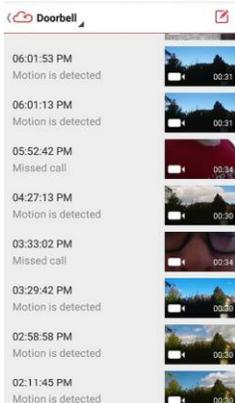

### Quiet Hours

You can schedule quiet hours so that your doorbell is silent during those periods, just in case you're trying to catch some shuteye or don't want to be disturbed.

### Device Sharing

Share any device with friends, family, etc. and let them view and control your doorbell. Other users must have a free MeShare account.

### Alerts

Receive alerts on your smartphone for missed calls, motion detection, etc. and review past alerts at any time. Click on each alert to view playback footage of an automatically recorded clip.
