# Adding your Zmodo WiFi Camera with NVR Kit
## Supplemental Instructions

What this guide is for
Please make sure that you are trying to connect an "HD WiFi Camera NVR Kit" product. If, when following the instructions on the quick guide to add your kit, you do not see the NVR on the device naming screen as shown to the left then you will need to follow these instructions to add your NVR to your Zmodo account. We apologize for the inconvenience.
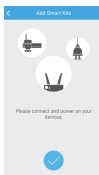

1. Please make sure that you have connected all of your cameras successfully. When following the instructions on the quick guide, you should see all of your cameras listed in the device naming screen. Name and set a password for your cameras. When completed, your cameras will be added to your Zmodo account as a camera kit.

If you do not see all of your cameras, then you will need to repeat the instructions on your quick guide to add your remaining cameras.

2. Add your NVR using the "Wireless Device and Smart Kits" connection method, and select the "Smart Kits" option. Make sure that your smartphone is connected to the same WiFi network that your cameras are connected to. Open the "Add Device" menu, and select the "Wireless Device and Smart Kits" connection method. Select the "Smart Kits" option.
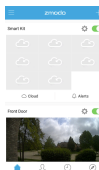

3. Make sure that your NVR is powered on and properly connected. Check to see that your NVR is plugged into the power adapter and powered on. Please also make sure that the NVR is connected to the same router that your cameras are connected to, using an Ethernet cable. If it is properly connected, you can press the check button to proceed. The app will automatically search for any NVRs that are connected to your internet.

4. When the app finds your NVR, check the circle next to the NVR and proceed. If your NVR does not appear, please double check the connections from step 3, and make sure that your phone is connected to the same WiFi network as your NVR and cameras.

5. Select "Finish" to name and set a password for your NVR. You will not need to configure any wireless cameras. Set a name and password for your NVR Kit, and tap the check button to complete setup.

6. Delete your camera kit from the device list. Your NVR kit is successfully configured! The NVR will automatically add your WiFi cameras to its video feed. Once you have added the NVR, you can delete the camera group from step 1 from your device list. You may do so by pressing and holding the Device Tile until it prompts you to delete it.
